EVEglyphDesign · PMO offering

Universal DI Framework PMO Model

The PMO that runs inside your systems.

Lilian Corvington — Practice Lead, Universal DI Framework PMO · EVEglyphDesign

v1.0 — 2026

EVEglyph

A management consulting PMO team that runs your SAP transformation inside your own systems. Every document, every decision, every reasoning step lands in your private repository as your trade secret from day one — and stays there when we go.

What you get

Four things, delivered by the team, kept by you.

Documents

Reference: a global retailer's country-by-country SAP programme (IKEA), where every proposal, blueprint, and specification was drafted in the client's own environment and versioned on the client's own systems.

Proposals, blueprints, functional and technical specs, meeting minutes. Drafted from your workshop notes, priced from your scope, versioned every time you change them. Every document says who wrote it, what it was built from,

EVEglyph

and when.

Risks

Reference: a European telecoms transformation (Vodafone), where scope and change signals were tracked continuously against workshop context and surfaced to the steering committee before they became invoices.

Scope movement, decision drift, and early warnings — tracked against the workshop record you already have. You see a change coming while there is still time to price it, not after it lands in the invoice.

Changes

Reference: configuration work driven by plain-language questions against the project's own ALM

record, with every change reviewed and approved by a human on the client team before it reached S/4HANA.

Ask the system a plain-English question about your SAP project. It drafts the change, shows you exactly what it will do, and only pushes to S/4HANA after your team approves it. No push without a signature.

Tests

Reference: test scenarios and evidence generated straight from the same requirements record the specs were drafted from, aligned to SAP Activate, kept alongside the deliverables in the client repository.

EVEglyph

Test scenarios written from the same requirements the specs were drafted from. Scripts generated, runs scheduled, evidence kept next to the deliverables. When audit asks what you tested, the answer is in one place.

How the team is built

Every consultant on the team runs their own twin. The twin does the drafting, the tracking, the querying, and the test-writing on the client's side of the wall — using the client's own tools and the client's own data. Nothing crosses back to

EVEglyph

us.

The twins coordinate through protocol standards, not through a shared platform we own. Lilian sits at the top of the triangles and keeps the client's programme moving as one thing, not four.

When we finish, the twins go home with the client. The reasoning stays where the work was done.

EVEglyph

The point. Your project's context reasoning is a trade secret. It is your workshops, your decisions, your language, your people. It should never live on a vendor's platform. With this model, it does not.

Inside the boundary, what the twin sees

The context reasoning repository is the twin’s working memory: the unstructured and semi-structured project record on one side, and read-only connectivity to your Client

Sovereign data estate on the other. Planning and execution assumptions are reasoned against the actual business data — something no company should ever want done outside their DMZ.

Compared to a packaged AI assistant

We compare to Luzid because a management consulting group we work with brought it to us, and it is the cleanest example of the packaged category. The comparison is not about who has more features. It is about where the

reasoning ends up.

Where the work lives

Our model. In your own private repository, on your own systems, from day one.

Luzid. On Luzid's platform, behind a Luzid login.

Who owns the reasoning when the engagement ends

Our model. You do. Every context artifact is a trade secret you already own.

Luzid.

How the team is organised

Our model. Every consultant runs their own twin. Twins produce reasoning on your surface, coordinated through protocol standards. A team lead keeps the programme moving as one thing.

Luzid. One central agent (David) on a shared vendor platform, operated by their implementation team.

Deliverables — documents, risks, changes, tests

EVEglyph

Our model. Drafted in your environment, versioned on your systems, reviewed by your team, kept in your repository.

Luzid. Drafted on Luzid's platform, exported to your tools, retained by Luzid.

Protection of your trade secrets

Our model. Your data never leaves your boundary. Reasoning happens on your side of the wall.

Luzid. Your data crosses into Luzid to be reasoned on.

What is behind the outputs

Our model. A public decision-intelligence framework with a 96-source evidence register. Your team can read it before you sign.

Luzid. A vendor marketing site.

Same four things on the page. Different thing in your building six months later.

EVEglyph

The framework behind the model

The PMO model is one delivery pattern of a broader decision-intelligence framework we publish openly, with primary sources cited throughout. If your team wants to read the argument before we talk, start there.

- Decision Intelligence Framework — peer-review draft (v1.2)
- EVEglyph Executive Boot Contract — operating canon
- Source repository for this brief
